No turbulence

turbulence

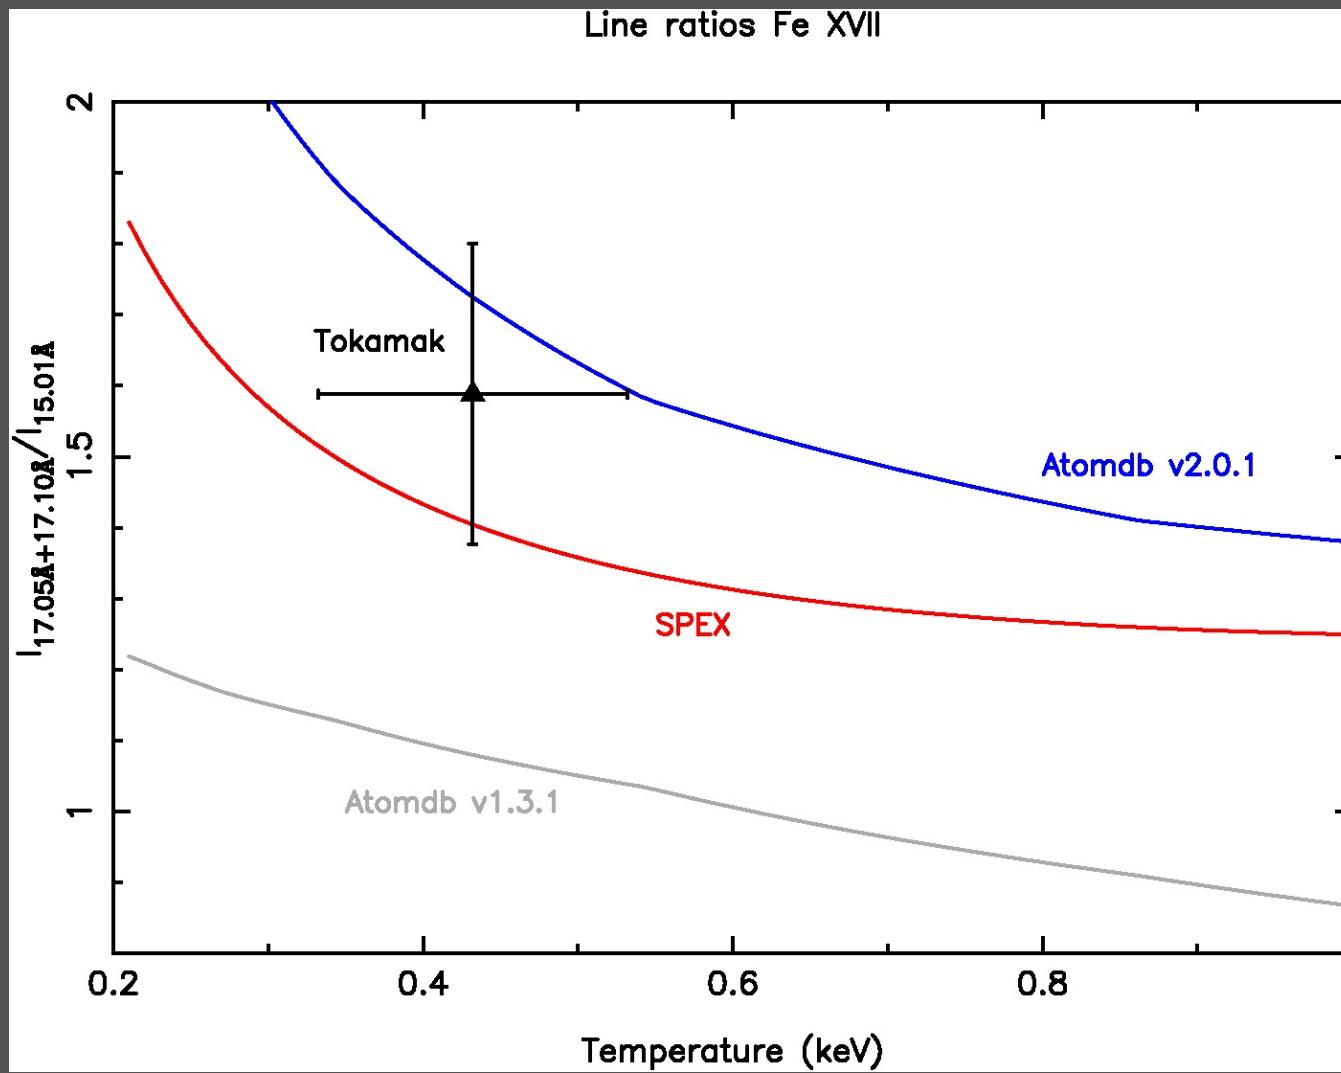

Resonant scattering of Fe XVII lines through RGS

Turbulent velocity and 15Å line suppression

Theoretical & measured Fe XVII line ratios

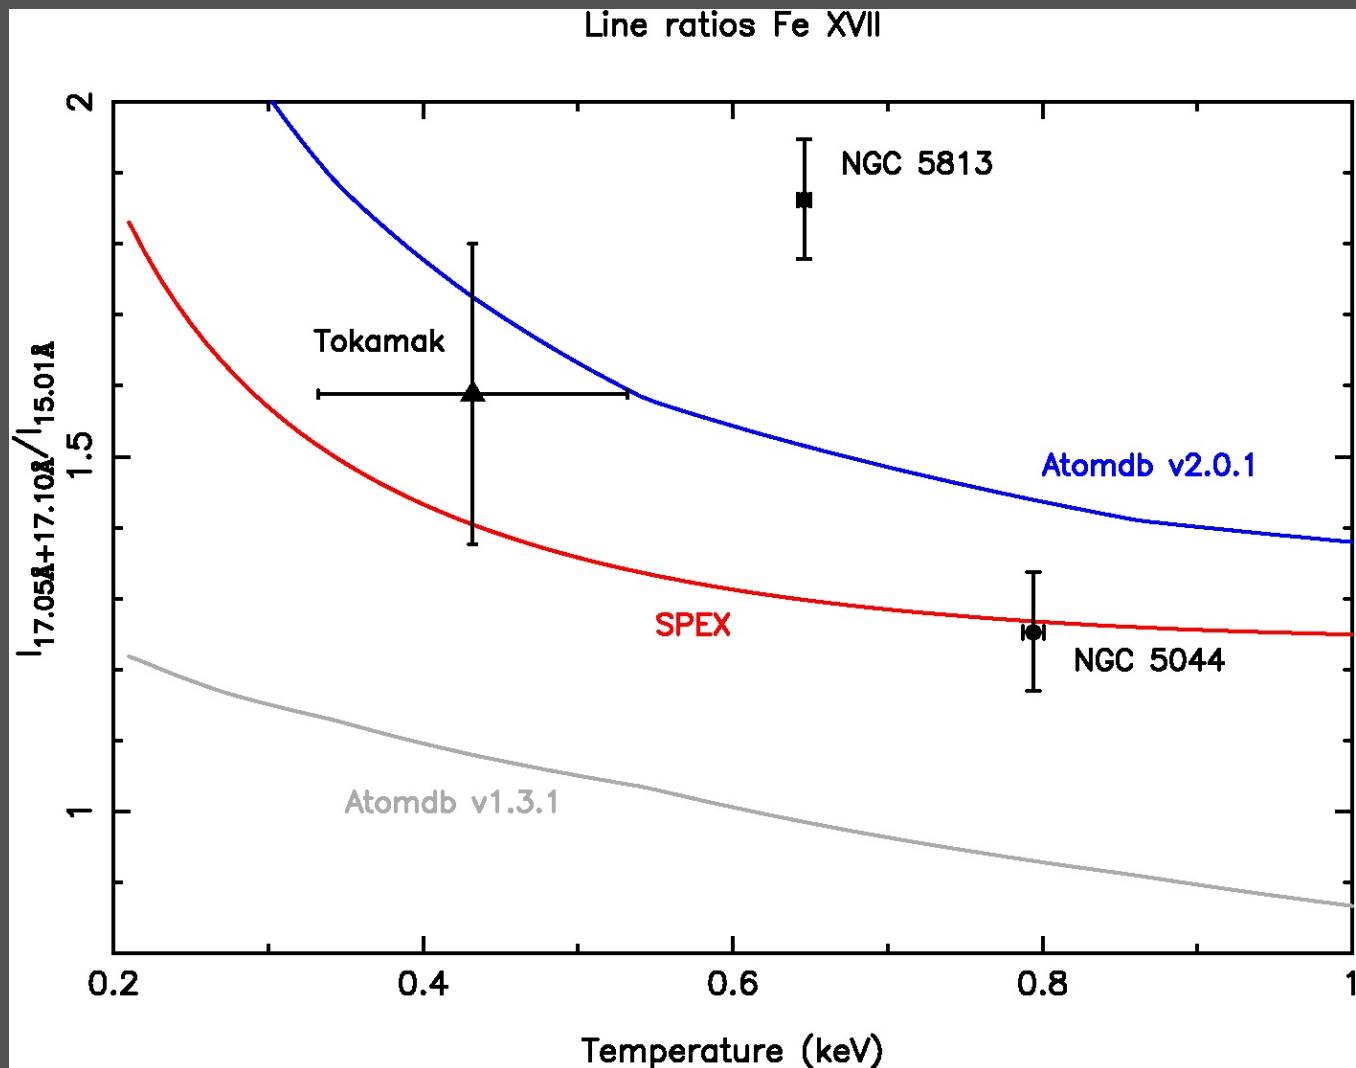

Theoretical line ratios Fe XVII (17A/15A)

- **Atomdb 1.3.1**: 'basic' di-electronic recombination (DR) & radiative recombination (RR)
- **Mekal (Xspec)**: DR & RR estimated through scaling laws
- **Mekal (SPEX)**: DR & RR included (Doron & Behar 2002)
- **Atomdb 2.0.1**: DR & RR included (calculated internally)

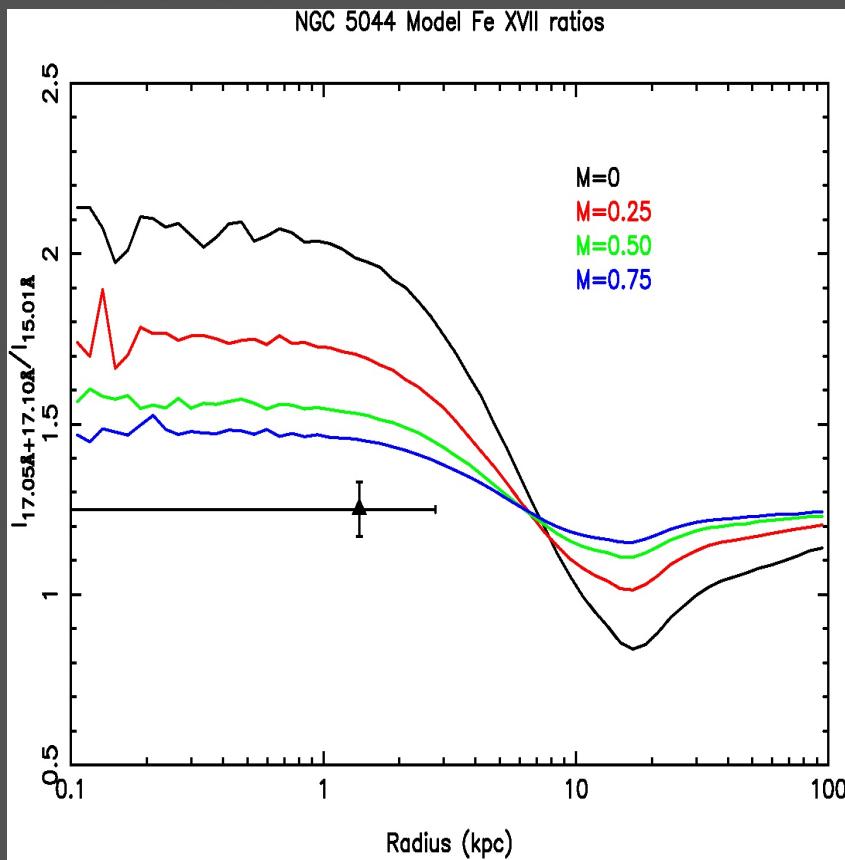

Differences between models do not arise from DR & RR alone

NGC 5813 & NGC 5044 line ratios

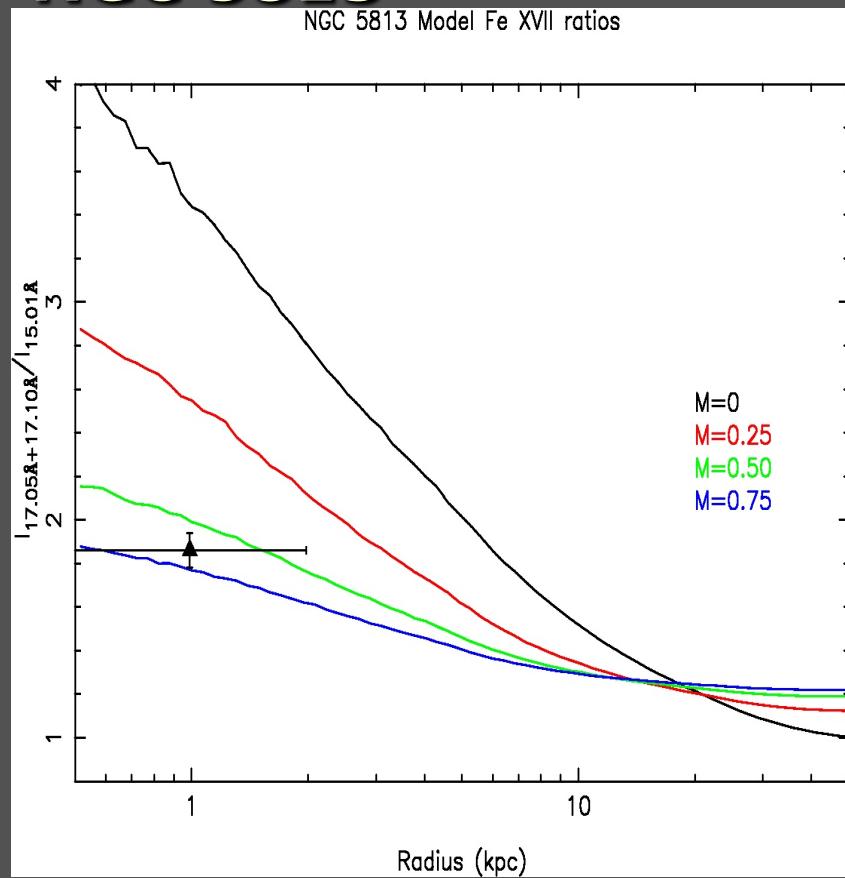

Modeling resonant scattering

NGC 5044

NGC 5813

Velocity estimates assuming Doron & Behar line ratios

Parameter	NGC 5044	NGC 5813
Sound speed	~460 km/s	~420 km/s
Line width (90% conf)	< 775 km/s	< 500 km/s
Resonant scattering	> 230 km/s	250 ± 100 km/s

Warning: preliminary numbers!

Conclusions

- Turbulence in NGC 5044 and NGC 5813 constrained
 - NGC 5044: $230 < v_{\text{turb}} < 775 \text{ km/s}$
 - NGC 5813: $250 \pm 100 \text{ km/s}$
- Connection to group morphology – sloshing/swirling
- Mekal/Atomdb 1.3.1: 'basic' DR and RR underestimate ratio
- Atomdb 2.0.1: Appears to overestimate line ratio (2 sig. level)
- Doron & Behar 2002 reasonable estimate (Fe XVII 17/15 A)
